

ABSTRACT

A battery provided with one end of each lead element connected to the positive and negative electrode respectively is drawn out from the can body 3 through a space 6 formed at 5 a surface part of said jointed flange section 32a, 32b and the area of the flange section around the drawing space is sealed by a resin bonding.

The battery provided with a new structure which can solve the problems which may be generated in all fields, such 10 as battery shape, attachment property, battery strength, productivity and so on in order to make a thin type battery.
